

Forey Forest Intelligence Challenge

Evaluation Criteria and Judging Guidelines

Each solution is evaluated across four shared criteria. Teams do not need to solve the same problem or use the same technology, but every solution must demonstrate a connection to forest data, a potential role for Forey, and a real user decision.

Weightings

Evaluation criterion	Weight
Technical implementation and working demo	30 %
Innovation and value to Forey	25 %
Commercial potential and pilot feasibility	25 %
Clarity and persuasiveness of the presentation	20 %
Total	100 %

Scoring

The judge awards each evaluation criterion a score from 1 to 5. Half-points are also allowed.

1. Technical Implementation and Working Demo – 30%

Evaluate:

- Has the team built a working demo or technical proof of concept?
- Does the solution include genuine analysis, computation, classification, simulation, or optimization?
- Is the data flow from measurement to result understandable?
- Is the chosen technical approach fit for purpose?
- Can the architecture credibly scale to a larger area or dataset?
- Have data quality, uncertainty, and validation been addressed?
- Have safe use, information security, and access controls been considered as appropriate for the solution?

Scoring Guide

1/5 – Idea without technical evidence

The solution is primarily a concept or a user-interface mock-up. There is no concrete evidence that the analysis works.

2/5 – Limited prototype

The solution includes technical components, but the core data processing or decision-making logic remains unclear or works only in a very limited way.

3/5 – Functional and credible demo

The core solution workflow works with sample data. The technical implementation and further development needs are described clearly.

4/5 – Strong technical solution

The demo works convincingly, the analysis logic is well justified, and the solution addresses scalability, data quality, and key edge cases.

5/5 – Exceptionally complete and insightful implementation

The solution combines a working demo, technical depth, thoughtful architecture, reliability, and a realistic path to production.

2. Innovation and Value to Forey – 25%

Evaluate:

- Is the problem or approach new, surprising, or particularly insightful?
- Does the solution genuinely use forest, terrain, or measurement data?
- Has a natural and credible role for Forey been identified?
- Does the solution show what more accurate, localized, or up-to-date data can enable?
- Does the solution change the user's decision or actions compared with the current situation?
- Is the solution more than an existing general-purpose solution rebranded with a forest theme?

Scoring Guide

1/5 – Weak connection to the challenge

The solution could operate almost unchanged without forest data or a potential role for Forey.

2/5 – Familiar solution with a limited forest connection

The solution includes relevant elements, but its added value or novel perspective remains limited.

3/5 – Clear and well-founded innovation

The solution has an identifiable new perspective, and forest data provides visible value.

4/5 – Highly insightful connection to Forey

The solution uses Forey's potential data or capabilities in a way that opens up a credible new use case.

5/5 – New product or market opportunity

The solution demonstrates an exceptionally strong insight that could realistically be developed into a new product, service, or strategic capability for Forey.

3. Commercial Potential and Pilot Feasibility – 25%

Evaluate:

- Has a paying customer or buyer been identified?
- Is the customer's problem real, significant enough, and understandable?
- Has the value delivered by the solution been described or estimated?
- Is the first pilot scoped realistically?
- Has a measurable success criterion been defined for the pilot?
- Can the solution become a repeatable product or service?
- Is Forey's role in the commercial offering credible?
- Has the first step toward market entry or customer acquisition been identified?

Scoring Guide

1/5 – No identified customer

The solution has no clearly defined user, buyer, or commercial benefit.

2/5 – Possible need, but unclear execution

A customer or problem has been identified, but the benefit, pilot, or willingness to pay is based on assumptions.

3/5 – Credible customer and pilot

The solution has a clear customer, an understandable value proposition, and a realistic first pilot.

4/5 – Strong business concept

The benefit is significant, the pilot metrics are clear, and the solution could develop into a repeatable service.

5/5 – Exceptionally strong commercial opportunity

The solution combines an urgent customer need, a strong value proposition, a realistic pilot, and a credible, scalable business model.

4. Clarity and Persuasiveness of the Presentation – 20%

Evaluate:

- Can the audience quickly understand the problem and the solution?
- Does the presentation have a clear structure and story?
- Does the team clearly demonstrate what it built?
- Is the analysis or decision-making logic explained clearly?
- Is the value to the user communicated clearly?
- Does the presentation stay within the five-minute time limit?
- Can the team answer questions and recognize the limitations of its solution?

Scoring Guide

1/5 – Difficult to understand

The problem, solution, or significance of the demo remains unclear.

2/5 – Partly understandable

The presentation contains relevant content, but the overall solution, demo, or value proposition is not communicated clearly.

3/5 – Clear and effective presentation

The problem, solution, demo, and commercial concept are communicated clearly in the presentation.

4/5 – Compelling overall presentation

The presentation is clear, well paced, and demonstrates both the technical and commercial value of the solution.

5/5 – Exceptionally impactful presentation

The team summarizes a complex solution exceptionally well, delivers a convincing demo, and leaves a clear impression of why the solution should be pursued further.

Tie-breaks

If two teams receive the same total score, the higher-ranked solution is determined in the following order:

1. higher technical implementation score
2. higher innovation and value to Forey score
3. higher commercial potential score
4. a joint decision by the judging panel
